

## BROCHURE

# Better network visibility

### Enrich data context

- NetFlow, IPFIX and metadata correlation
- Mapping of username to IP
- Layer 7 visibility
- Wide support of 3rd-party exports

### Reduce cost and increase efficiency

- Fast, accurate reporting with rich context
- One scalable database with a single interface
- The data you need when you need it most

### Physical/virtual visibility

- Monitor east/west traffic
- Visibility across both underlay and overlay
- Visualization of software-defined WAN, LAN, and data centers

### Scale and speed

- Fast reporting delivers fast results
- Supports millions of flows per second
- Hierarchical architecture delivers the industry's greatest scale

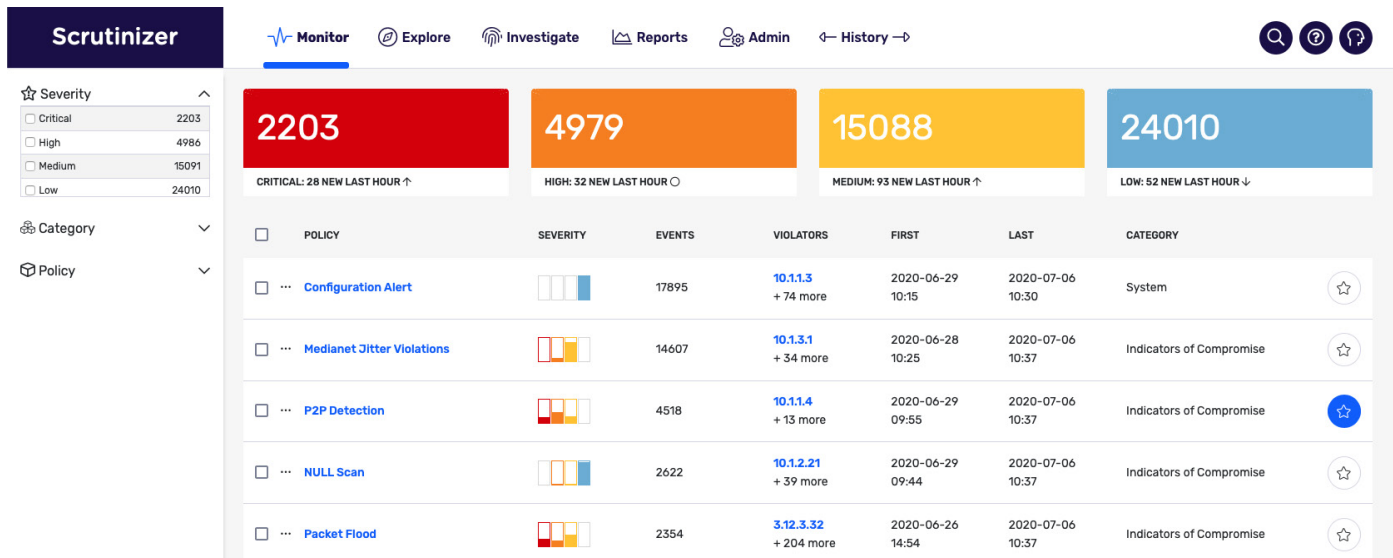

Plixer Scrutinizer® collects, analyzes, visualizes, and reports on data from every network conversation and digital transaction to deliver security and network intelligence. It provides the insight and historical data needed to manage and optimize business operations while reducing risk by detecting and remediating incidents. Unlike competing solutions that require the addition of many expensive and proprietary appliances, Plixer's implementation collects data that is exported directly from the existing infrastructure (switches, routers, firewalls, packet brokers, etc.). This differentiated approach is frictionless, eases implementation, reduces complexity, and improves ROI.

### Enrich data context

Simply having access to high volumes of raw data does not automatically lead to faster response. In fact, it can have the opposite effect, increasing complexity and slowing response times. What you need is context and data correlation. Many systems on the market gather from many data points, but don't provide context to make the data useful. If you have, for example, a list of connections to Netflix on your network, but can't identify which users have accessed Netflix, how useful is the data?

Better context comes by correlating network-related data with metadata from various network locations. Root cause analysis is most efficient when you can instantly bring together the user, device, location, protocol, and application data (including URL and URI) for every flow on the network. Plixer Scrutinizer delivers by collecting, visualizing, and reporting on data that extend all the way from the user through to the cloud. It also provides real-time detection of DDoS attacks, minimizing disruption and loss of revenue.

Through partnerships and technology integration with companies like Cisco, Juniper, Gigamon, Ixia, Palo Alto Networks, Citrix, VMware, Extreme Networks, Endace, Splunk, and many others, Plixer Scrutinizer provides the data you need for fast and accurate

incident response. Furthermore, Plixer Scrutinizer’s integration with Cisco ISE, ForeScout CounterACT, and Microsoft Active Directory enables the association of an IP address with usernames, countries, and groups, which saves hours of manual effort and provides immediate accountability.

### Visibility across physical and virtual environments

The introduction of virtualization and virtual networking doesn’t have to lead to loss of traffic visibility. With Plixer Scrutinizer, data can be gathered, correlated, and visualized across physical, virtual, and cloud environments. Now IT can ensure that virtual and software-defined networks are maintaining the highest performance possible.

### Scalable data collection and speed of reporting

As the volume of flows and available metadata rapidly grows, platform scalability and speed of reporting become paramount. Plixer Scrutinizer scales to millions of flows per second with resilient hierarchical deployments, enabling streamlined and efficient data collection. Additionally, Scrutinizer has been purpose-built to deliver the fastest reporting in the industry.

Plixer Scrutinizer is built on a strong foundation of providing total visibility, informational accuracy, and flexibility. With the industry’s deepest context and fastest reporting, it provides the source-of-truth for network operations teams. It seamlessly integrates into your unique network topology, working alongside the industry’s most prominent vendors and technologies to deliver the data you need when you need it most.

### Extend security capabilities even further

As an add-on to Plixer Scrutinizer, [Plixer Network Intelligence](#) uses advanced Machine Learning (ML) to analyze Scrutinizer’s metadata, augmenting NetOps staff capabilities. It analyzes Scrutinizer’s metadata to augment NetOps staff capabilities. It dynamically predicts network capacity requirements, automates network operation functions, improves investigation efficiency, dynamically shares data with SecOps, streams network traffic data external data lakes, and streamlines workflows through ServiceNow integration.
